BestCV

AI-assisted recruiting inside Microsoft Power Platform. Post jobs, receive CVs by email, and review scored candidates in your own environment.

What BestCV does

BestCV helps HR teams post jobs and review candidate CVs inside Microsoft Power Platform. It runs as a Power Apps app in your own environment, keeps its data in Microsoft Dataverse, and runs its processes in Power Automate.

Prepare jobs

Create, edit, close, and reopen job posts using your company's own job titles. Improve a job description with AI and generate a job poster image.

Receive CVs by email

Candidates email their CV to a company mailbox. BestCV reads the CV, links it to the job, and adds a summary and a match rating.

Review candidates

Search candidates, compare the AI summary with the original CV, download the CV, and record a decision and comments.

Share jobs on LinkedIn

Optionally publish a job to an authorized LinkedIn member account. Updates are posted again, and the post is removed when the job closes.

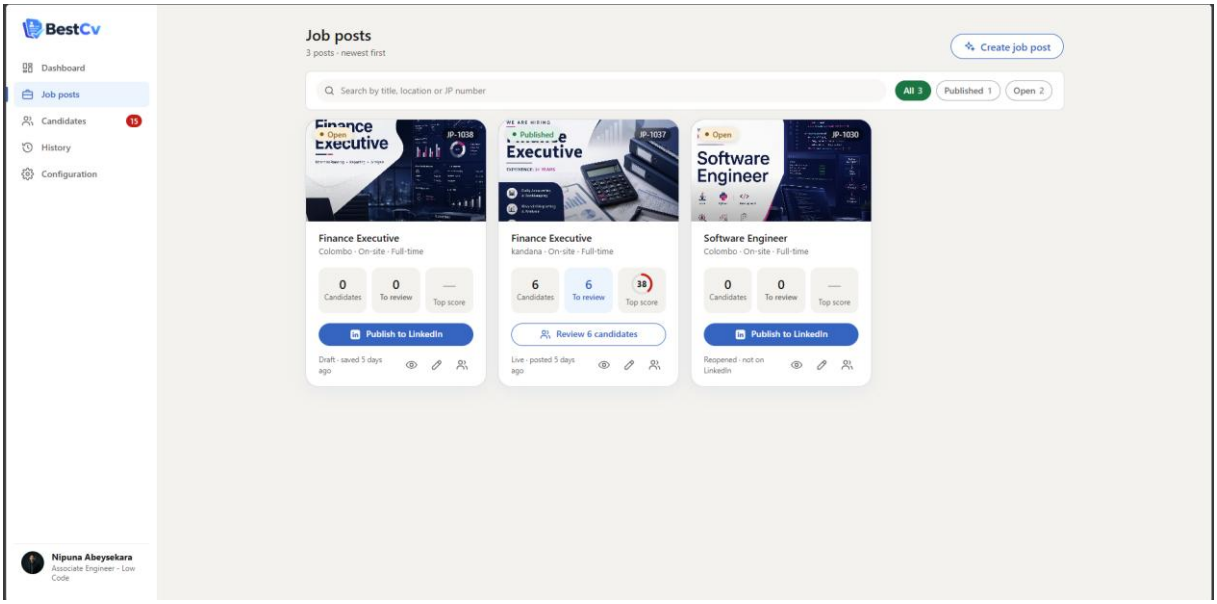

Figure 1. Job posts: create, publish, and track jobs from your own job titles

How it works

1. **Post the job.** HR creates a job with one of the company's job titles and can let AI polish the description.
2. **A CV arrives by email.** Azure AI Document Intelligence reads the CV, and Azure OpenAI compares it with the job description.
3. **BestCV scores it.** The candidate record gets a match rating (Strong, Possible, or Weak), a summary of strengths and missing skills, and the original CV file.
4. **HR decides.** HR reviews the candidate against the original CV and records the decision. The score supports the review; it does not replace it.

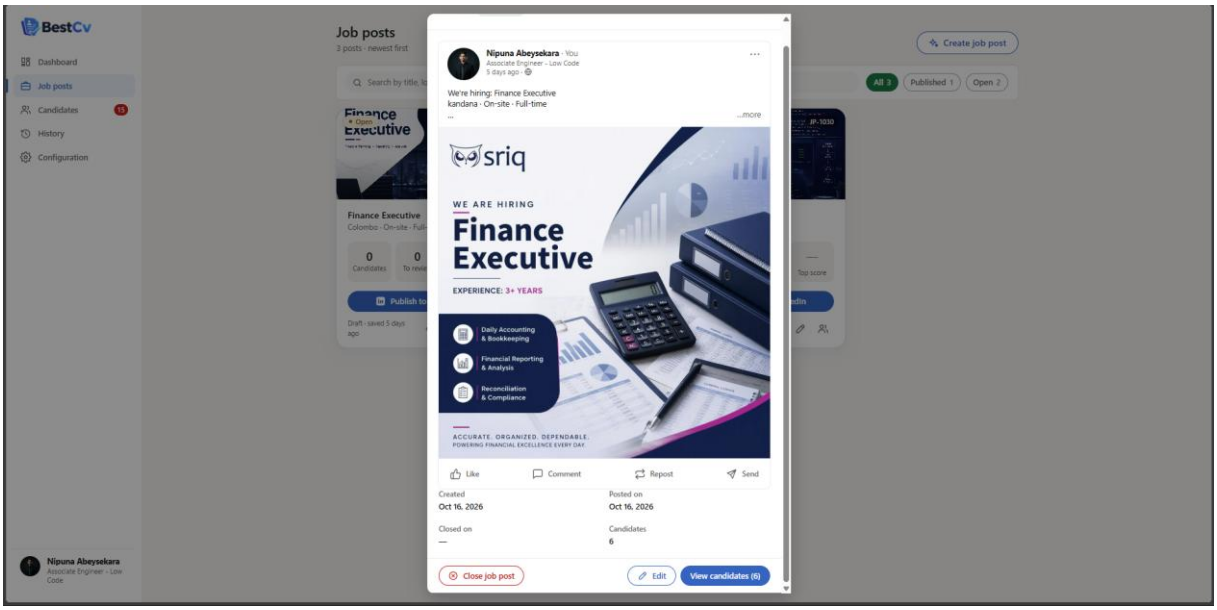

Figure 2. Each job shows its LinkedIn post, its candidates, and the actions to edit or close it

Scoring that follows your priorities. Admins set the rules the AI uses to score CVs. There is no need to write AI prompts: describe a plain wish, such as "Prefer candidates with Power Platform experience", and BestCV rewrites it into complete scoring instructions for you to accept.

Your data stays with you

BestCV runs in your Microsoft tenant and uses your own Dataverse environment, your own mailbox, and your own Azure AI resources. SRIQ Corporation does not run these services and does not receive your candidates' data.

Who it is for

HR and recruitment teams in organizations that already use Microsoft 365 and Power Platform and want CV screening and job posting in one place, without moving candidate data to an outside system.

What you need

- A Power Platform environment with a Dataverse database, with code apps enabled by an administrator.
- A Power Apps Premium license for every user (or pay-as-you-go, App Pass, or auto-claim).
- A Microsoft 365 (Outlook) mailbox that receives candidate CVs.
- Azure AI Document Intelligence and Azure OpenAI resources in your own Azure subscription.
- Optional: a LinkedIn developer app, only if you post jobs to LinkedIn.

Good to know

- AI summaries and scores can be wrong. HR staff check them against the original CV before deciding.
- LinkedIn posting publishes to a LinkedIn member account. It is not LinkedIn Jobs, LinkedIn's own Easy Apply, or a certified LinkedIn ATS integration; applicants apply by email.
- BestCV does not run in Power Apps for Windows or in SharePoint forms.

Pricing and contact

BestCV is sold as one subscription per company. Contact SRIQ Corporation for a quote. Power Apps user licenses and AI usage are billed separately by Microsoft through your own subscriptions.
